Installation of Git in Windows.

- Go to the download page of git given in the link. Click here
- Once download is complete install with default settings.
- After completion of installation, open git bash terminal and type the following
 - ➤ git --version
- This should display the version that you downloaded from the link.

Basic Configuration of git.

- In order to give a username and email for all the commits done from the machine, we add username and email to the git configuration file.
- Type the following commands in the git bash
 - ▶ git config --global user.name "<YOUR NAME>"
 - ➤ git config --global user.email "<YOUR EMAIL>"
- Note replace content in <> with your details
- E.g. git config --global user.name "jonhdoe"
